Marmorens hemmeligheter

Secrets of marble

The author has been hunting for an access to a not yet revealed cave system for a long time. He describes an area with several marble bands stretching from the fjord well up to the tree-line. (In Norway this can be anything from 700-1000 metres above sea level).

The area has several small lakes and seems to very well drained. On a small plateau he found some dolines. The larger ones are 3m in diameter and 9 m deep. Sediments fill the bottom. Except for the lakes, the area looks dry, so the drainage is good.

He has found some small entrances, but being alone, they have not been surveyed yet. He will be back with survey equipment and friends and hope to present his discoveries in the future.
