Flaggermus og is i Svarthamarhola

Bats and ice in Svarthamarhola.

A hibernating bat was observed at the "Old Sump" in Svarthamarhola 22nd march 1981. The species was not determined, but the body was about 8 cm long. Water fluctuations in "Old Sump" and on the ice mass proper during 1981 are also shortly discussed. At the inner end, the ice was submerged in about 2 m of water on the 7th of June.
