Utforskningen av grottene i Vadveriehppidalen 2008 - 2013

The exploration of the caves in valley Vadveriehppi 2008-2013

The cave Golfbanan was found by members of SSF in 2007. In the following years, 2008-2013, more than ten speleologists from SSF have been surveying and mapping this and other caves in the valley, connecting one after the other to the major cave system of Vadveriehppi. The system consists of both fossil and vadose passages, huge halls, narrow crawls and pitches which require SRT. There are several other caves in the valley, some of them may be connected to the main system. This year, 2014, a greater range of SSF members and others are invited to the area to continue the work of mapping and exploration.
