Grotting i Norge januar 2017

Caving in Norway January 2017

A visit to Bonnå, Sørfold, northern Norway is reported where caves in marble, 45 km north of Fauske are threatened by the proposed realignment of the E6 main road. (See NGB nr 67). Outside the temperature fell to minus 15 degrees Centigrade. In the caves where there were transparent icicles and some flowing water it was about zero. The ice formations were up to 10 cm in diameter and 1 m high. There were large fallen rocks (frost shattering or earth movement?) and some tight awkward squeezes.
