Fellestur til Leka

Fellestur til Leka

This article describes a geological visit by a Norwegian caving club to an island called „Leka“ in northern Norway. The island is unique because it was once part of America. When it was shifted to Norway' s west coast it was also pushed up and now shows the original ocean bottom of thousands of years ago.

A phenomenon due to chemical reactions are the yellow stones which change colour in the evening light to red. Further information is given about the island's early exploration, cave paintings and Norwegian tales.
