Grotter i Grønli floet

Caves in the Grønliflåget cliff

Grønligrotta and Setergrotta are classical Rana caves, and still the G.-S. connection has to be found.

Isgrotta-Langgrotta is composed of a phreatic maze as well as a straight, square-shaped passage resulting from collapse into the overlying schist, descending down dip and ending in a blank schist wall.

Grønligrotta. The survey on p. 29 shows some important additions to Oxaal's 1913 survey - but the accuracy is lower.

The Full English version of S. St .Pierre's "Studies in Grønligrotta" is presented on pp .31-35.

Ratadalsgrotta is an overflow resurgence for the Strokkbekken stream. It is short but sporting.
