Undersøkelser i Blakkådalen juli 77

Examinations in Blakkådalen July 1977

Although the marble bands in Blakkådalen are steeply dipping, the topography doesn't create any great depth potentials. Unexplored stream caves were found at VP 748 834 and 722 792, and a climbable shaft into a 16-17 m deep cave at VP 730 801.
